Hydraulic Structures

In particular, the shear reinforcement should be designed for the excess shear, the difference between the hydraulic factored ultimate shear force, , and the shear strength provided by the concrete, , where Uh the Vuh φVc φ is the concrete resistance factor for shear design.

Reinforcement of other grades and types permitted by ACI 318 may be permitted for special applications subject to the approval of higher authority.

If you still experience any difficulty in downloading or opening this file, you may need to close some applications or reboot your computer to free up some memory. The maximum center-to-center spacing of both primary and secondary reinforcement should not exceed 18 inches.

The guidance in this ETL differed from ACI 318 Building Code Requirements and Commentary for Reinforced Concrete primarily in the load factors, the concrete stress- strain relationship, and the yield strength of Grade 60 reinforcement.

Improvement of the method of calculating the strength of inclined sections in massive reinforced

For instance, to design a building, the structure can be broken down into the following elements.
