### NEWA

MuTEA uses blower door measurements and steady-state efficiency measurements of space-heating and central water-heating equipment if available. Near the end of the project, an alternate test method was developed to better represent VRF system performance as if field installed. Likewise, doubling the heating degree days would roughly double the heating requirements.

### [PDF] Methodology to Calculate NO<sub>x</sub> Emissions Reductions from the Implementation of the 2000 IECC/IRC Conservation Code in Texas

To determine how  $T_o$  affects the ability of DD to explain within-population growth variation, we first show that the ability of DD to describe a growing season is robust to low values of  $T_o$ . This holds all variables constant except temperature, which is by far the most influential variable in determining energy use.

### A Perspective on Methods for Analysis of Measured Energy Data from Commercial Buildings

Using mean minutely is that a word? MuTEA uses the DOE-2 hourly simulation program to estimate the annual heating and cooling loads of the building and the annual space-heating and space-cooling energy consumptions required to maintain the building at the specified thermostat settings.

### Estimation of degree

The highest value of HDD is 2556. The electricity consumption in Seoul shows a maximum value in January, which decreases until May.
