## Tropical moist forests: Destruction and species extinction

Areas rich in endemism are north-east India, the Western Ghats and the north-western and eastern Himalayas. Most of the expansion since 2003 though has been in Brazil, particularly the Amazon. Meyer Rhizophoraceae , Laguncularia racemosa, Avicennia germinans Avicenniaceae , Conocarpus erectus Combretaceae , Drepanocarpus lunatus G.

## Biodiversity Profile of India

In addition, water stable isotope oxygen-18 and deuterium analyses were carried on lagoon water samples using laser spectrometry LS2120-i, Picarro Inc. In the north-west, India borders on Pakistan; in the north-east, China and Burma; and in the east, Burma. Land Use Cover Change Land use classification accuracy for both satellite images ranged between 61.

## Tropical moist forests: Destruction and species extinction

The country is home to around 846 million people, about 16% of the World's population 1990 figures. At site B, dissolved oxygen levels were higher in the wet compared to the dry season; site C showed the opposite seasonal influences in dissolved oxygen levels.

## Priorities for conserving global species richness and endemism

The authors are also grateful to Ms. Indian rosewood Dalbergia latifolia, Malabar Kino Pterocarpus marsupium, teak and Terminalia crenulata , but they have now been cleared from many areas.

## The Protected Areas System

These protected areas, shown in are distributed throughout mainland India and its islands. A Revised Survey of the Forest Types of India.

## **Mangrove Forest Characterization in Southeast Côte d'Ivoire**

Lognormal plots of mangrove prop root density in  $1 \times 1$  m plots at the different localities.
