## Introduction to Functional Analysis

For carbon and nitrogen the current correction is found to be, in some cases, larger than 10 ppm. The idea is to analyse functions into sine and cosines or, equivalently, complex exponentials to find the underlying frequencies, their strengths and phases and, where possible, to see if they can be recombined synthesis into the original function.

## Functional linear regression after spline transformation

Typically, a very small number of B-spline knots is needed. Although  $E$  is not concave, it is readily seen that the reparametrized energy  $\mathcal{E}$  is concave.

## Techniques of Functional Analysis for Differential and Integral Equations

If the original data do not satisfy the linear assumption, an intuitive solution is to perform some transformation such that transformed data will be linearly related. Let  $M$  be the compact multiplication operator associated with a  $\alpha \in L^1(\mathbb{R})$ , a bounded function with compact support over  $\mathbb{R}^3$ . This name is unrelated to our notation of density matrices.
