## Do Native Grasses Help Pollinators?

Compensatory dynamics are rare in natural ecological communities.

## Molecular and Physiological Basis of Colour Pattern Formation

Insect color patterns are particularly suitable for the study of the mechanisms of pattern formation because two-dimensional in nature. Caterpillars of the alcon blue butterfly have developed an outer coat that tricks ants into believing the young are its own, duping the ants into carrying the larvae back to their colonies to care for. Very minimal damage to the cover including scuff marks, but no holes or tears.

## Results for: Category: Bargain Books > Birds

This is especially true of the smaller moths, some groups of which spend their larval life in - in-between the upper and lower membranes of leaves - and in other unexpected places. This suggested that regularly exploited ants have somehow adapted a defence against the butterflies.
