**Joshua Angrist**

As a robustness check, we perform the analysis after restricting our sample to individuals in lower age ranges. When and by whom should data be collected and analyzed? In Handbook of Econometrics 6B J. Such a connection can point the way toward a factor  $e$ .

## Returns to Education in Germany: A Variable Treatment Intensity Approach

These patients need interventions that modulate their symptoms.

## Returns to Education in Germany: A Variable Treatment Intensity Approach

Patients at high psychological risk eg. pain catastrophizing, fear of movement, anxiety, and depression should receive psychologically informed rehabilitation.

## Foreign languages and trade: evidence from a natural experiment

It can also highlight connections correlations among variables, and call attention to factors you may not have considered.

## Returns to Education in Germany: A Variable Treatment Intensity Approach

Using transaction data and the regression discontinuity design methodology, Egger and Lassmann find high trade effects of different native languages in the Swiss cantons.

## Chapter 37. Operations in Evaluating Community Interventions

The level 2 clinical decision classifies such patients into 3 stages: 1 stage I is for patients with severe pain and disability status; the goal of the

interventions is symptom modulation; 2 stage II is for patients whose pain is not too severe but interferes with their activities of daily living; the goal of the treatment is improving muscle impairments to perform activities of daily living; and 3 stage III is for patients who are relatively asymptomatic and can perform standard activities of daily living but need to return to higher levels of physical function; the goal of the treatment is to improve the patient's ability to perform higher levels of physical function without symptoms exacerbation. In order to deliver effective early-detection and preventive services, decision makers require timely and valid information about the potential of proposed prevention measures to reduce occupational and environmental exposures and of strategies designed to alter health-related behavior.
