## An investigation into the mixed mode delamination behaviour of brittle composite laminates

At least five major delaminations can be observed in the highlighted portion of the photograph. The simulation results were used to perform a parametric study, from which the effects that certain design parameters have on the severity of rotor delevitation events are determined.

## VHDL Behavioral Modeling Style

Assuming that crack growth is the only energy absorbing mechanism the net work is then converted into a GGC once the area of the created fracture surfaces is determined. Remarkably, a considerable compressive traction was needed to prevent dilation of the interface. These values were determined based on Equation 5.

## An Investigation Into the Level of Fidelity Required to Model Heat Exchangers of a Heat Recovery Steam Generator

The finite element results agree very well with experimental data. Use of SBFEM reduces the meshing burden and complexities in the discretisation.

## An investigation into bicycle steering and roll responses

As such, current test practices and global data reduction schemes are inadequate and do not provide a complete picture of delamination behaviour.

## A holistic investigation into the seasonal and temporal variations of window opening behavior in residential buildings in Chongqing, China

Parametric AE analysis was conducted for the factors such as amplitude, energy released, signal duration and cumulative counts, for each AE signal.
