Quantitative response variables including attempt latency and struggle duration were analysed using standard least-squares regression and zero-inflated negative binomial regression, respectively. Alternatively, small males might be responding to variation in their perception of sperm competitive ability rather than asymmetries in precopulatory sexual selection.

To the extent that this outcome is indicative of male persistence, then the subset of hypothesis iii regarding size-dependent male perseverance is refuted. Why should selection produce distinctly different alternatives to reach the same goal? We examined whether phenotypic plasticity in ejaculate traits were manifest in the swordtail *Xiphophorus nigrensis*, an internally fertilized fish with size-dependent alternative male reproductive tactics.
