

Multiple endocrine neoplasia type 2 - International Symposium at the International Wissenschaftsforum, Heidelberg 1987

G. Thieme - Expertos

Diagnosis of multiple endocrine neoplasia type 2

- Medullary thyroid carcinoma (MTC) is suspected with an elevated plasma calcitonin concentration.
- This is a specific and sensitive marker. In provocative testing, calcitonin concentration is measured before and 2 and 5 minutes after intravenous administration of calcium.
- Parathyroid abnormalities are diagnosed when there are simultaneously elevated serum calcium and parathyroid hormone levels with an elevated urinary calcium to creatinine ratio.

Description: -

-
Calcitonin -- Congresses.
Multiple tumors -- Congresses.
Thyroid gland -- Cancer -- Congresses. Multiple endocrine neoplasia type 2 - International Symposium at the International Wissenschaftsforum, Heidelberg 1987
-
Frenchs acting edition -- no.1110
Hormone and metabolic research -- no. 21. Multiple endocrine neoplasia type 2 - International Symposium at the International Wissenschaftsforum, Heidelberg 1987
Notes: Includes bibliographical references.
This edition was published in 1989
