Here we briefly summarize the progress and the scientific results. As a result, we present in detail the technological improvements that were used to make this work a reality.

While such reports paint one potential future pathway, they are necessarily constrained by the ground rules and assumptions under which they are developed. Spirit was targeted to Gusev Crater, a 300-km diameter impact basin that was suspected to be the site of an ancient lake.

We report here the results of investigations of the applicability of commercial cloud computing to scientific computing, with an emphasis on astronomy, including investigations of what types of applications can be run cheaply and efficiently on the cloud, and an example of an application well suited to the cloud: processing a large dataset to create a new science product. Elucidation of this history will require a comprehensive program of field mapping, geophysical sounding, in situ analyses, and return of samples to Earth that are representative of the planet's diversity. With this configuration, the evaluation compares the performance of some of these technologies when deployed on virtual machines and on bare metal nodes.
