## Experimental evaluation of the importance of colonization history in early

In this study, we employed a carefully controlled experimental model that allowed us to elucidate the importance of colonization history in early-life gut microbiota assembly by varying arrival order and timing of complex seed microbial communities in previously germ-free mice. In contrast, the population sizes of *L. Primer* sequences and PCR fragment lengths are presented in.

## Giuri donore

Microbiome assembly begins at birth and undergoes dynamic processes influenced by factors such as birth method, feeding method, and antibiotic treatment. Pups were weaned at  $21 \pm 1$  days after birth, and the parents were euthanized to collect their ceca for microbiome analysis; pups were placed into separate cages according to sex. With respect to historical processes, ecological theory holds that the timing and order of species immigration during community assembly can cause variation in the structure and function of communities, or historical contingency, through priority effects and monopolization ;.

## Regeni, Augias: Legion d'Onore, ma disposto a rivedere

E, proprio per sostenere questa tensione per così tanto tempo, Hawks alleggerisce la trama con le contaminazioni leggere da commedia che non annacquano affatto la suspense ma semplicemente distraggono lo spettatore per fargli riprendere fiato.

## Experimental evaluation of the importance of colonization history in early

Priority effects can arise through niche preemption or modification ; , or through in situ evolution by which earlier colonizers adapt to gain an advantage over later colonizers through monopolization. The current annotation count on this page is being calculated. The adaptive immune system is not a major contributor to historical contingency in gut microbiota assembly From a microbial ecosystem perspective, the vertebrate gut is unique in that not only can the microbial community members adapt through monopolization during assembly , but the habitat host can also respond and adapt towards the community during postrnatal development ;.
