In 1998, the phase 3 Oxford device was introduced with new instruments and an increased range of component sizes to facilitate its implantation through a short incision Figure 6. Periprosthetic osteolysis with total knee arthroplasty. A recent study from England Journal of Arthroplasty Dec 2001; 16(8):970-6 compared the rehabilitation of minimally-invasive partial knee replacement patients with the rehab of patients who had partial knee replacements done through a longer incision as well as with patients who had conventional total knee replacements.

The femoral and tibial components were cemented into place, and the procedure was completed by inserting the appropriately sized polyethylene bearing. This is done to re-orient the loads that occur with normal walking and running so that these loads pass through a non-arthritis portion of the knee. The cuts for the femoral component were made with a cutting block, which allowed for the removal of three slivers of bone to fit the shape of the nonarticular surfaces of the component. The extension gap could then be increased until it matched the flexion gap as measured with the feeler gauges. Although there is some level of inflammation present in all types of arthritis conditions that fall into the category of true inflammatory arthritis are often very well managed with a variety of medications and more treatments are coming out all the time.
