## People at Center for Embryonic Cell and Gene Therapy

The thyroid is one of the earliest endocrine organs to differentiate and has an important hormonal role in embryonic development. New findings on the specification and fate decisions of thyroid progenitors, and the morphogenesis of precursor cells into hormone-producing follicular units, are also discussed. Do Thyroid Disrupting Chemicals Influence Foetal Development during Pregnancy?.

## Colorado School of Energy Studies

D Toxic adenoma: increased uptake in a single nodule with suppression of the surrounding thyroid.

In areas of endemic iodine deficiency, where soil and therefore crops and grazing animals do not provide sufficient dietary iodine to the populace, food fortification and supplementation have proven highly successful and sustainable interventions.

## Mitochondrial replacement therapy

Transfer techniques include direct injection into damaged tissue and injection into vessels that supply blood to the tissue. We can speak of an upper and lower section of the spine only.

## Endocrine

Each arch has initially identical structures: an internal endodermal pouch, a mesenchymal core, a membrane and an external cleft. Mutual repression between msh and Iro-C is an essential component of the boundary between body wall and wing in Drosophila.

## Center for Embryonic Cell and Gene Therapy

A second application is to use mitochondria to replace mitochondria in damaged tissue to restore the tissue to a functional state. At the University of Washington, I was part of a research team that focused on lung disease and injury, while at the University of Virginia my research focus was on

the blood-brain barrier and the role of respiratory depressants.
