Each Outline presents all the essential course information in an easy-to-follow, topic-by-topic format. For example, he develops the same example through his presentation of the first law and both forms of the second law—entropy and exergy. New topics included are national income accounting, lags in demand stabilization, the Phillips curve and monetarist macroeconomics.

Authors Desmond Winterbone and Ali Turan also include a detailed study of combustion to show how the chemical energy in a fuel is converted into thermal energy and emissions; analyze fuel cells to give an understanding of the direct conversion of chemical energy to electrical power; and provide a study of property relationships to enable more sophisticated analyses to be made of irreversible thermodynamics, allowing for new ways of efficiently covering energy to power e. The author places a strong emphasis on the concepts of availability and irreversibility with respect to both nonreacting and reacting systems.
