Poverty and fever vulnerability in Nigeria: a multilevel analysis

Although the specific mechanisms underlying the increased mortality are unknown, plausible explanations may include the fact that mothers with little or no education residing in communities deprived of prenatal care by a doctor are more vulnerable because they are generally poorer and lack the economic means for essential goods and services health care, medications, and transportation compared to mothers with higher education and access to prenatal care. Multivariate predictors of fever After controlling for all the predictors simultaneously in a multi-level model, fewer predictors remained significant Table. Multidimensional poverty status of rural households in Nigeria: Does family planning have any effect? Children of mothers resident in the South South region had a 15% higher risk of under-5 death HR: 1.

Poverty and fever vulnerability in Nigeria: a multilevel analysis

Variance partition coefficients and Wald statistic were used to express measures of variation.

REGIONAL VARIATIONS IN INFANT AND CHILD MORTALITY IN NIGERIA: A MULTILEVEL ANALYSIS

There are no significant variations in multidimensional poverty between sub-regions in the south. Exposure variables Region of residence of the mother was the main exposure variable, categorized as five sets of dummy variables: a North Central, b North East, c North West, d South East, and e South South. For instance, the results show a lower risk of death in infancy for children of mothers residing in communities with a high proportion of hospital delivery HR: 0.

The Determinants of Regional Poverty in Nigeria Project Topics : Current School News

Children aged 6-11 months and 12-23 months reported more fevers 19.

Regional inequalites in under

Mothers in the North Central and North East regions who lived in communities with the proportion of secondary or higher education at the median level for the community made up most in the sample Table. Children aged seven months and above were more likely to have fever than those less than six months. Multidimensional poverty among rural households in Ogun State, Nigeria.

Regional inequalities in under

The elaboration of policies for poverty alleviation requires a thorough knowledge of the poverty phenomenon as well as an understanding of the efficiency of implemented programmes Okurut et al. Journal of Biosocial Science 26 4 , 469—477. Thus, the proportion of mothers with secondary or higher education is a predictor of child survival.

REGIONAL VARIATIONS IN INFANT AND CHILD MORTALITY IN NIGERIA: A MULTILEVEL ANALYSIS

Lack of resources prevents people from seeking timely health care. Who gets AIDS and how? Statistical analysis The distribution of the individual and community-level characteristics in the sample was assessed separately by region of residence in order to assess the unadjusted effect of these characteristics on region of residence.

Multidimensional poverty and its determinants: Empirical evidence from Nigeria

Measurement and determinants of multidimensional poverty: Evidence from Taiwan. Malaria is one of the most important challenges to public health with about 300 to 500 million cases reported annually. Economic status and health in childhood: The origins of the gradient.
