Developing utilization maps is a joint responsibility of rangeland managers and livestock operators and is essential for adaptive management. An FDCH is an organized nonresidential child care program for children, generally 12 years of age or younger, operated in a private home, and licensed or approved to provide care. In addition to the effects of grazing and browsing of vegetation, large herbivore and recreation use can cause physical disturbance to stream systems.

### Laboratory Tests

If use periods are longer than a week or two during the growing season in uplands where deep-rooted perennial grasses, or hot season where riparian conditions, are the goal, both duration and intensity of use are important.

### Nevada Rangeland Monitoring Handbook (3rd)

Solution: Download and install one of the recommended web browsers below. These data address conformance with the grazing plan.

### Family Day Care Home Monitor Handbook

Declaring drought based solely on the USDA Drought Monitor data which is not recommended by the National Drought Mitigation Center misses the ecological principle that shallow-rooted plants, such as grasses, depend on soil moisture. Therefore, seasonal use measured within the growing season is often used as a trigger for livestock movement.

They can be identified with a use map for closer study to determine causal factors and potential solutions. If left in one place, they show accumulating effects from protection, thatch, attracted rodent activity or bird droppings, and altered microclimate snow drifts, etc. In these cases, management should be designed to promote an increase of stabilizing plant species, and bank alteration may not be an effective measure of chosen strategies to effect this outcome.

## **Nevada Rangeland Monitoring Handbook (3rd)**

However, when these forms are used for the whole pasture and not for specific use areas, much information is missing.

## **Nevada Rangeland Monitoring Handbook (3rd)**

Steambank Alteration Streambank alteration is often measured as the percent of the line at the edge of the streambank that has been broken or deformed, although there are a number of different methods that have specific rules, and the methods produce different results. Monitoring plans should include gathering information on weather temperature and precipitation and growing conditions soil moisture. Long-term monitoring can also identify known instances where strategies have been effective in reducing or halting fire spread, or the burning conditions that allowed a fire to cross a fuel break.
