[PDF] Modular construction of nervous systems: A basic principle of design for invertebrates and vertebrates

Filesize: 19.46 MB

This is especially true with regenerative

reproduction, in which an organism is divided, and each part becomes a full version of itself. One of the hallmarks of bilaterians is the central nervous system. Are several advances view of this brain and the optic lobes can be found.

Homology and ontogeny: pattern and process in comparative developmental biology, Theory in Biosciences

Journal Theory in Biosciences — Springer Journals Published: Jan 15, 2008 APA Scholtz, G. Cerebellum is a centre of muscular coordination, it is larger than that of cyclostomes and diploans.

A homology definition is favoured which includes similarity and complexity serves as a test for homology. The diencephalon consists of a dorsal epithalamus, a lateral thalamus, and a ventral hypothalamus. Except the first four pairs of cranial nerves, the rest arise from the medulla oblongata.

The nervous systems of Cnidarians

The olfactory lobes are fused together in the median plane. But all the three divisions of the nervous system are connected intimately both structurally and functionally.

E

He moved to Georgia State University in 1997, where he is currently a Distinguished University Professor in the Neuroscience Institute.
