biogeography of Nothofagus and Trigonobalanus and the origin of the Fagaceae

The species is shown to be indigenous in Tonga, the first such evidence from the outlier, with certain identification of abundantly occurring pollen in an early Holocene mangrove peat, that pre-dates the arrival of man by some 2500 years. This book summarizes the status of the terminology in the various discipline that make up biotechnology.

BASIN MARGINAL NOTES TO A SYMPOSIUM on JSTOR

Descriptions of larvae of eight Nearctic species of Dolerus Hymenoptera: Tenthredinidae with focus on six Equisetum feeding species from the Ottawa region. These discoveries, as well as other more recent findings around Japan, contribute significantly to our understanding of the biogeography of the hydrothermal vent and cold seep communities in the Western Pacific. Fern spores are most likely dispersed through the air, and thus patterns of air movement have undoubtedly played a significant role in determining the geographic origins of the ancestors of the Hawaiian ferns.
