## Glycolipid

This binding causes leukocytes to leave circulation and congregate near the site of inflammation. They are used to modify the oligosaccharide structure of the after it has been added onto the lipid. The lipid and the saccharide form a through a , which is a.

## Male germ cell specific sulfogalactoglycerolipid is recognized and degraded by mycoplasmas associated with male infertility

They are involved in numerous biological functions ranging from immune response to nervous system signaling.

## Glycolipid

Antigens which are not present in an individual's blood will cause antibodies to be produced, which will bind to the foreign glycolipids. Sunderland MA : Sinauer Associates.

## Male germ cell specific sulfogalactoglycerolipid is recognized and degraded by mycoplasmas associated with male infertility

Glycolipids are found on the surface of all cell membranes, where they extend from the phospholipid bilayer into the extracellular environment. They can be bound to the C-terminus of a protein and have various functions associated with the different proteins they can be bound to.
