Statistics and Probability

These give the instructor insight into mastery of learning objectives and skills, both for the class as a whole and for individual students. .

Statistics and Probability

There's no signup, and no start or end dates. In particular, be able to identify unusual samples from a given population. We'll measure the position of data within a distribution using percentiles and z-scores, we'll learn what happens when we transform data, we'll study how to model distributions with density curves, and we'll look at one of the most important families of distributions called Normal distributions.

One of the main differences between the courses is the path through probability. This unit is organized into two modules — Sampling and Study Design.

For example, marathon OR race. We calculate p-values to see how likely a sample result is to occur by random chance, and we use p-values to make conclusions about hypotheses. This unit covers sampling and survey methods, observational studies, and basic experiment design.

Probability and Statistics

There are a number of ways to determine the probability of an event. This topic covers confidence intervals for means and proportions.

Statistics and Probability

Both probability units culminate in a discussion of sampling distributions that is grounded in simulation.
