The influence of clouds on climate is poorly understood. A present focus of interest for many researchers is the possibility of obtaining information about microstructures, for example surface roughness, and the size, shape and optical properties of particles by means of a non-invasive technique such as the illumination of these objects with light. Worked examples of the application of the FORTRAN programs show readers how to adapt or modify the programs for their specific application.

One of their main tasks is to extract the relevant information from a detailed study of the scattered radiation. In a series of one-hour lectures, they discussed current aspects of light scattering from microstructures with a special emphasis on recent applications.

This book also incorporates FORTRAN programs and simulation results. Consider, for example, the possibility of distinguishing between different types of atmospheric contaminants, biological contaminants in our blood, the detection of microdefects in the manufacturing of semiconductors, magnetic discs and optical components, or the development of biological sensors.

Contributions to solving this problem are important not only from the point of view of increasing basic knowledge but also in their applications to several fields of industry and technology. One of their main tasks is to extract the relevant information from a detailed study of the scattered radiation.
