Geology of Uranium Deposits

Mineral reserves are subdivided in order of increasing confidence into probable mineral reserves and proven mineral reserves.

Rare earths: resource distribution and production, reserves, supply and demand

Uranium has been adsorbed onto carbonaceous matter and consequently no discrete uranium minerals have formed.

Geology of uranium deposits

The matrix with these axes proved to be the most inclusive and descriptive. The latter observation implies that Mo had to be extracted from large volumes of magma at least several tens of km³ to produce a mid-sized deposit.

Geology of Uranium Deposits

A comparison between porphyry Mo-mineralized and barren occurrences reveals that the melts and fluids in mineralized systems were not unusually Mo-rich, which suggests that the mineralization potential was controlled by other factors.

Geology of uranium deposits

The 4% tailings exhibited a lower rate and amount of settlement than 5% and 6% tailings. These results imply a significant disconformity beneath the Naauwpoort Volcanics and suggest multi-phase rifting during the breakup of south-western Congo Craton from Rodinia.
