Road Crime Control and Reporting System for Public Service Vehicles in Developing Countries: A Case of Kenya

Weight sensors were to collect weight and compare with prescribed weight by vehicle manufacturers. A beeping alarm that increases in volume each minute a seatbelt warning goes unnoticed should be implemented.

Results and Discussions After the interconnection of the sensors in the vehicle, the driver should be able to see the number of seats occupied and the number of seatbelts fastened. In addition to this, it will also ensure that drivers stay on the right side of the law since a law has to be enacted to ensure that drivers who's point score is below a given value cannot be allowed on our roads. These are rules that ensured soberness on the road in terms of adhering to the laid out traffic rules. The system will avail this information to the

driver on a VDU that will be mounted on the dashboard. These would work with other motion detectors to activate sending of such images to law enforcers in case of violence in the vehicle.

Practical Challenges and Perspectives for the Development of Neurosurgery in a Peripheral East African Hospital During a One

Introduction Road Safety is a serious problem all over the world, its severity is more pronounced in the developing countries, especially in Africa. Alternatively, the system can use mobile carrier provided internet connectivity or direct satellite connections to upload the information at regular intervals. This information will be uploaded to any of the several Wi-Fi hotspots access points before uploading the data to the central server.
